

Tips for travelling

1. Install the **Mobilityplus app** on your smartphone (log in with your work email address).
2. **Don't forget your charging card**; this always gives you direct access to the entire MobilityPlus network (including at Fastned and Ionity charging points).
3. In the Mobilityplus app you will see the costs associated with the charge points. **Don't forget to look at the starting price and the parking fee**, which you have to pay on top of the price of the charging session.
4. In the MobilityPlus app you can also find **DC (fast chargers) by filtering on the tab "Speed"**; set the minimum charge power via the slider to 50 KW.
5. If your **charging card is lost**, please contact Mobilityplus; we will block the charging card to prevent misuse.
6. In extreme cases, **you can still start a charging session without a charging card via the MobilityPlus app**. Select the tab "Activation"; here you'll find a filter which gives you an overview of the charging stations where this is possible.
7. **Plan your trip** with <https://nl.chargepoint.com/mobile> . You can download this app for free and select the MobilityPlus network. With various search filters, you can then effortlessly find the charging stations that best suit your electric car. An average electric car travels 300 kilometers or more with a full battery. Calculate the number of stops required by dividing the total distance by the realistic range of the car. Be sure to include plenty of time.
8. **Do not charge for too long** because it is not recommended to charge your battery to over 80% with a superfast charger. It is better to charge several times for short periods, for example every 2 hours when you stretch your legs, before the next 2 hours of driving.
9. **Pay attention to additional consumption** - In general, the state of your battery is better suited for hot temperatures in summer than cold temperatures in winter. What you should pay attention to is the weight of your load in the car and possibly a roof box, both of which lead to increased consumption. Also the air conditioning can drain your battery faster so always keep this in mind.
10. It seems logical but **take charging cables** with you. It is best to take both the standard cable (usually a type 2 cable) and a cable for quick chargers (CCS plug). Most rapid chargers have a cable but at the slower charging stations you often need your own cable. And put your cables above your luggage, so you can quickly access them during your trip.
11. **Find a charging station when you arrive** so you can always go on the road with a charged battery during your vacation.
